

Setting the Standard for Automation™

Improving Analysis through Innovations in Gas Sampling

Tony Wimpenny

Orbital Gas Systems, UK

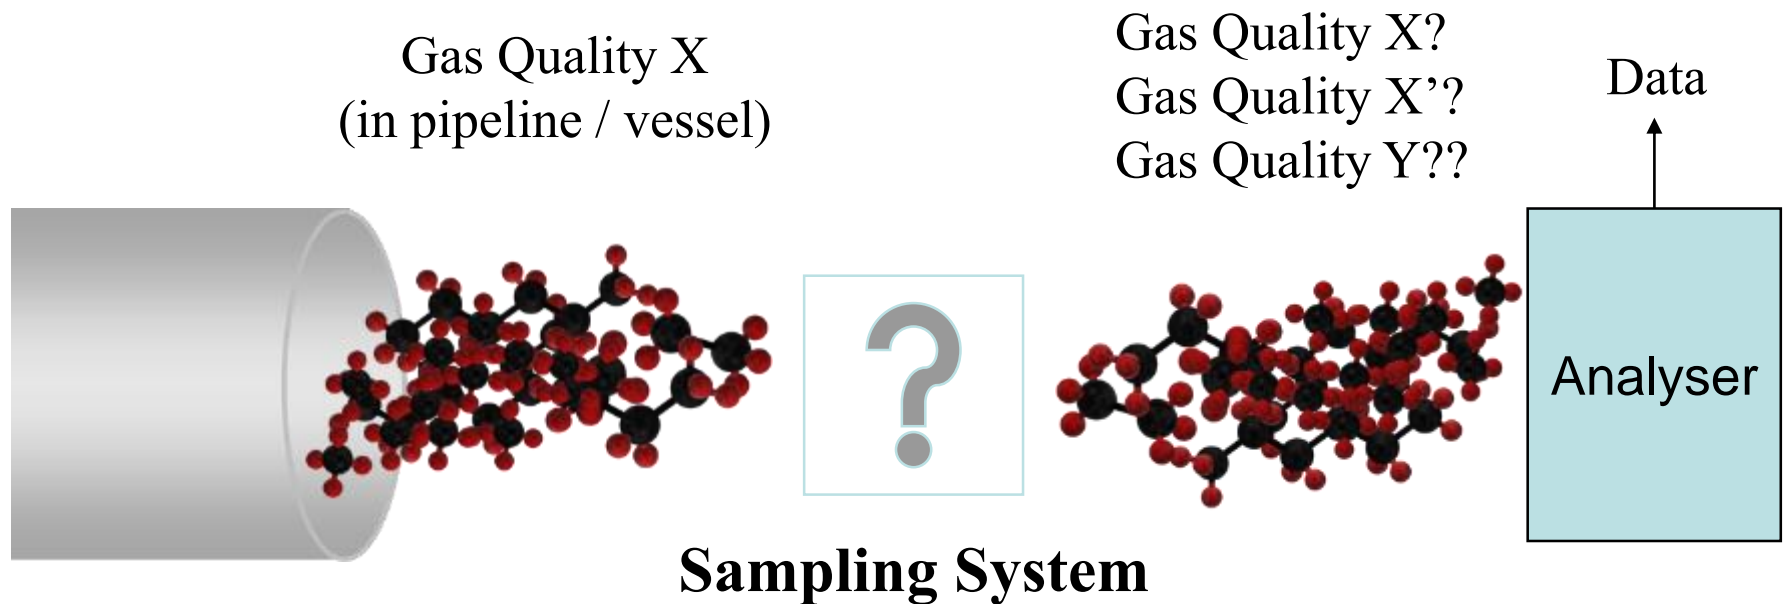

Standards
Certification
Education & Training
Publishing
Conferences & Exhibits

- Beng, Msc from University of Bath, Manchester
 - Specialising in materials
- 7 years Aerospace Engineering
 - Including 4 years in Bristol, UK and 3 years in Toulouse, France
- 1 year Production & Export @ EnDet / VE Technology
 - Produced and exported new advanced gas sampling technology
- 4 years (and counting!) International Sales @ Orbital
 - Manage global sales network and responsible for growth of sales of two patented product lines: VE Technology® and GasPT®

Basics of Sampling

A Simple Illustration

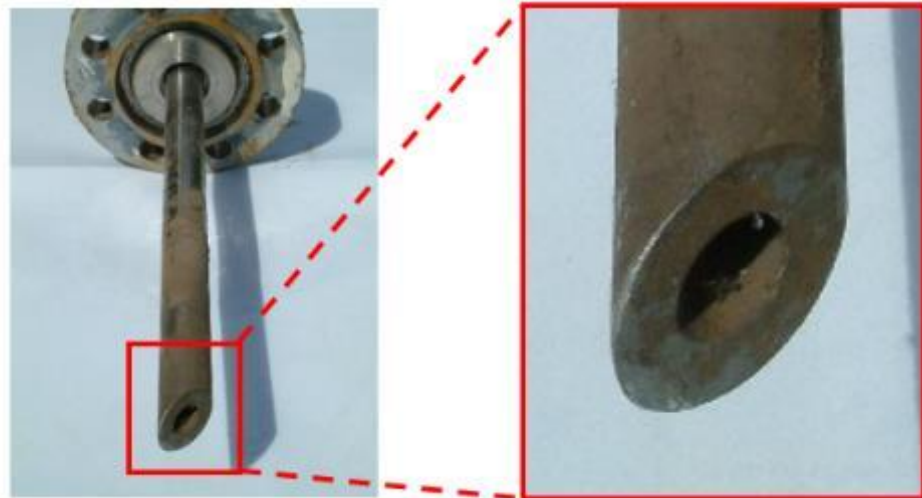

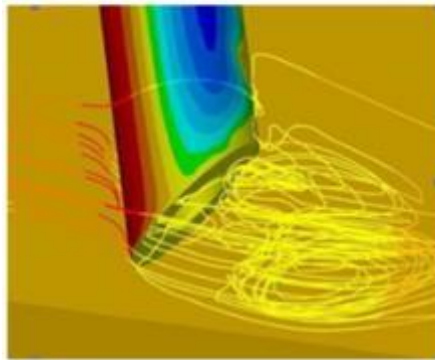

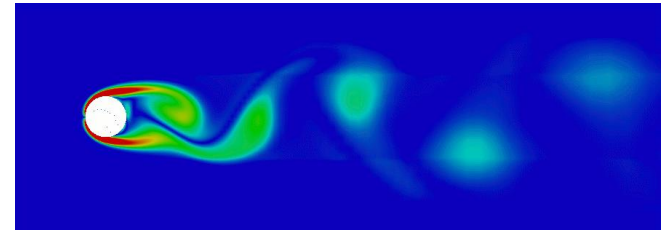

How to Achieve Good Measurement:

- I just need to buy the best (most accurate) analyser, right? (wrong!)
- Need to safely deliver gas from process to analyser:
 - Sample probe
 - Filtration
 - Pressure reduction
 - Sample transport tubing
- Sampling system is as critical as the analyser in achieving good measurement

Typical Probe Design Pipeline Type

Probe Design: In Pipeline

- Wake frequency headaches
- Gas disturbance issues at probe tip
- Contamination issues
- Surfaces and volumes

Typical Probe Design Pipeline Type

Illustration: Aerodynamic versus Non-Aerodynamic Shapes

Typical Probe Design Pipeline Type

Illustration: Localised Disturbance NOT Representative

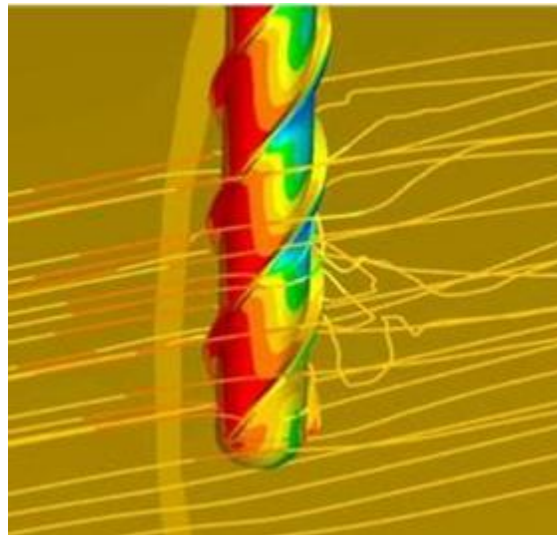

Alternative Probe Design Pipeline Type

Probe Design: In Pipeline

- Wake frequency headaches → solved!
- Gas disturbance issues at probe tip and contamination issues → solved!
- Surfaces and volumes → best available for measurement performance!

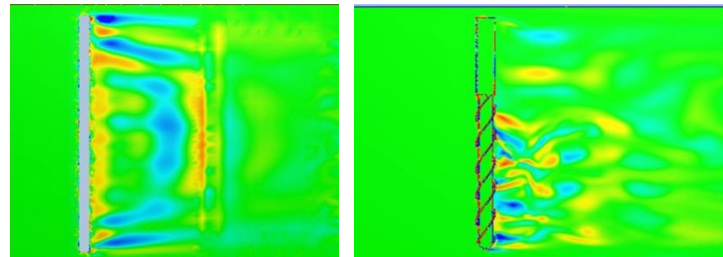

Helical Strakes Supporting Info

Numerous Papers & Studies

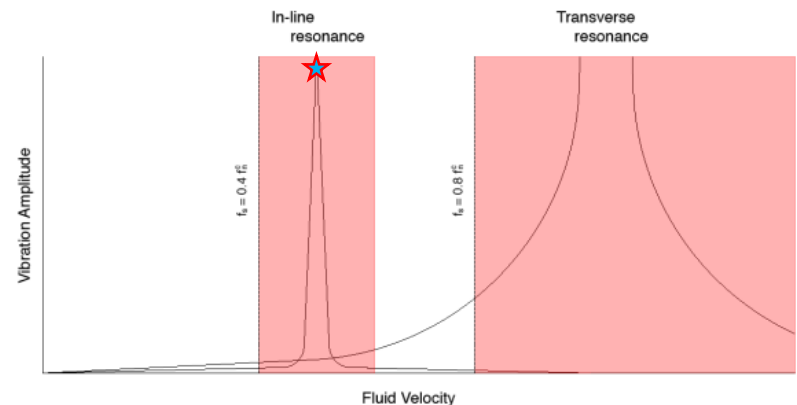

- **White Paper on Elimination of VIV by T. Knight, A. Wimpenny, Z. He** (*available for distribution*)
- **Scruton, C., Walshe, D.E.J., 1957. A means for avoiding wind-excited oscillations of structures with circular or nearly circular cross section, Nat. Phys. Lab. Aero. Rep. 335.**
- **Woodgate, L., Maybrey, J.F.M., 1959. Further experiments on the use of helical strakes for avoiding wind excited oscillations of structures of circular or nearly circular section, National Physical Laboratory, Aero Report Number 381.**
- **CFD Studies – by Daily Thermetrics Corp.** (*available for distribution – June 2017*)
- **Lab Studies – by Bath University and University of Manchester** (*available for distribution*)
- **Practical Study – SwRI® in the High Pressure Loop at the Metering Research Facility in San Antonio** (*available for distribution*)

Typical Probe Design In-bed Type

Probe Design: In Bed

- Unhelpful – doesn't deliver timely or accurate results
- Unreliable – subject to contamination issues

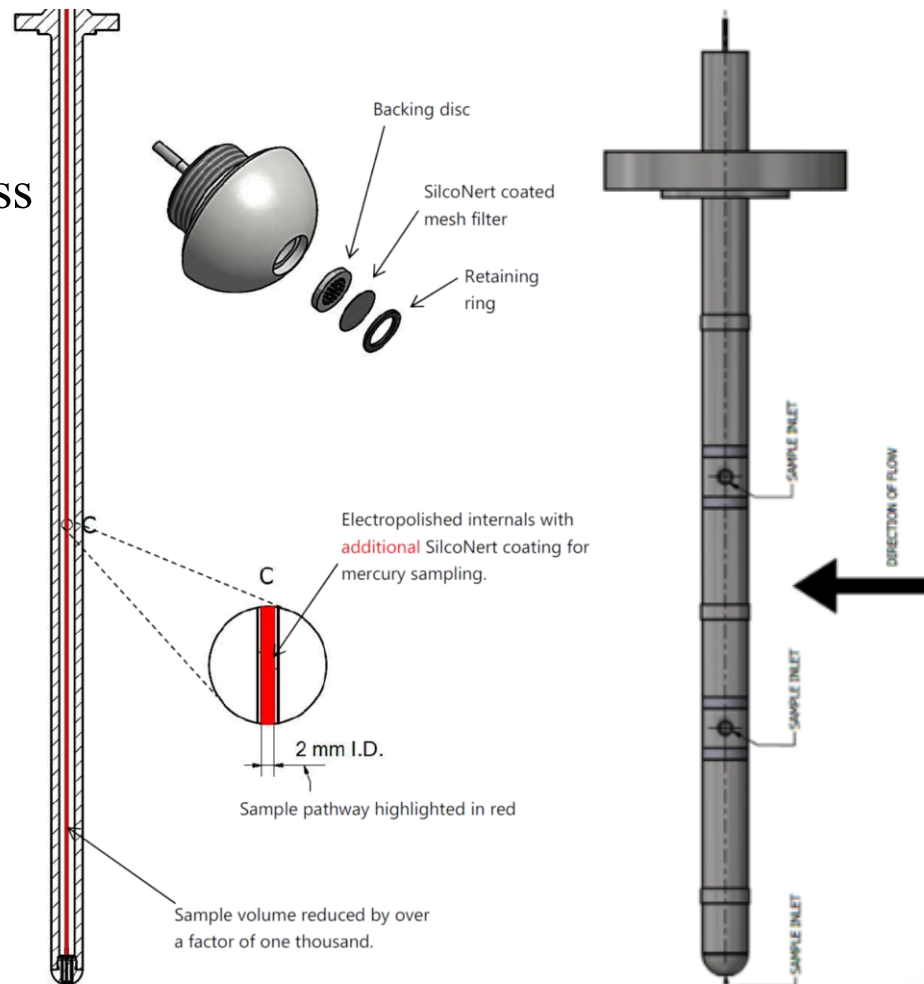

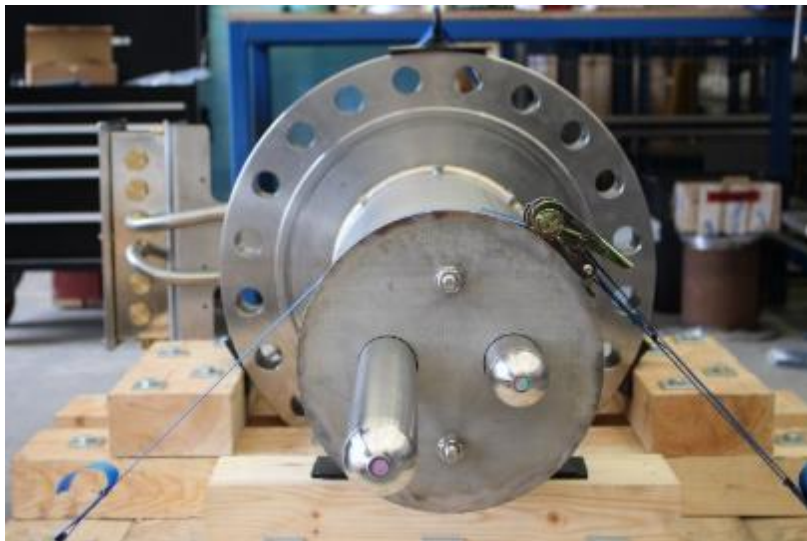

Alternative Probe Design In-bed Type

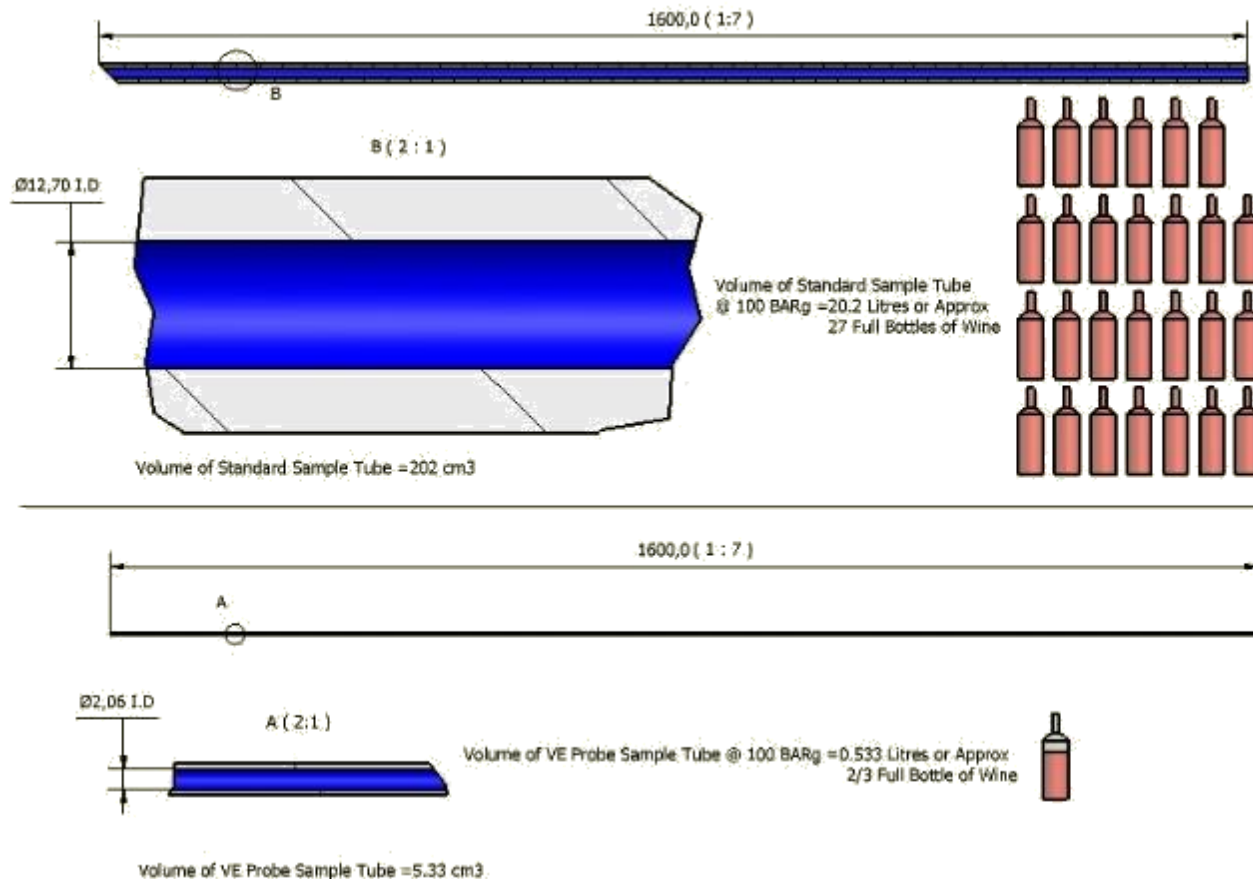

Probe Design: In Bed

- Small internal volume
- Electropolished (and inert) surfaces
- Tip design eliminates particulate ingress
- Combined sampling and temperature

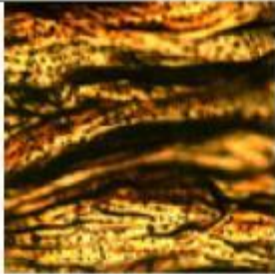

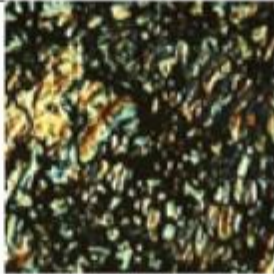

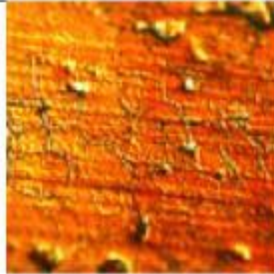

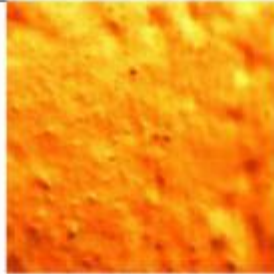

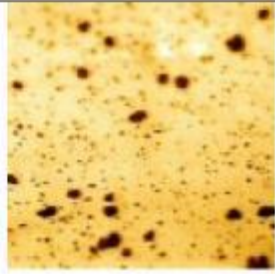

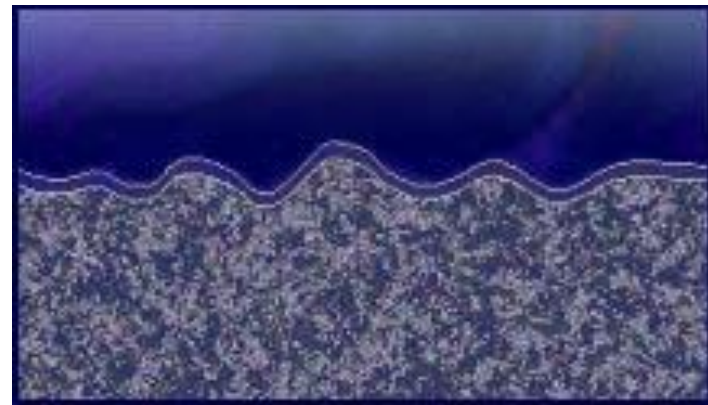

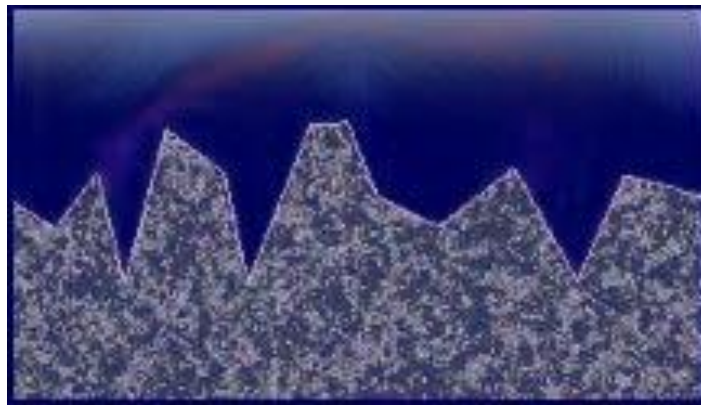

Surfaces and Volume Effects on Sampling and Analysis

Impact on purge time / analytical response, filtration, anti-JT heating, emissions!

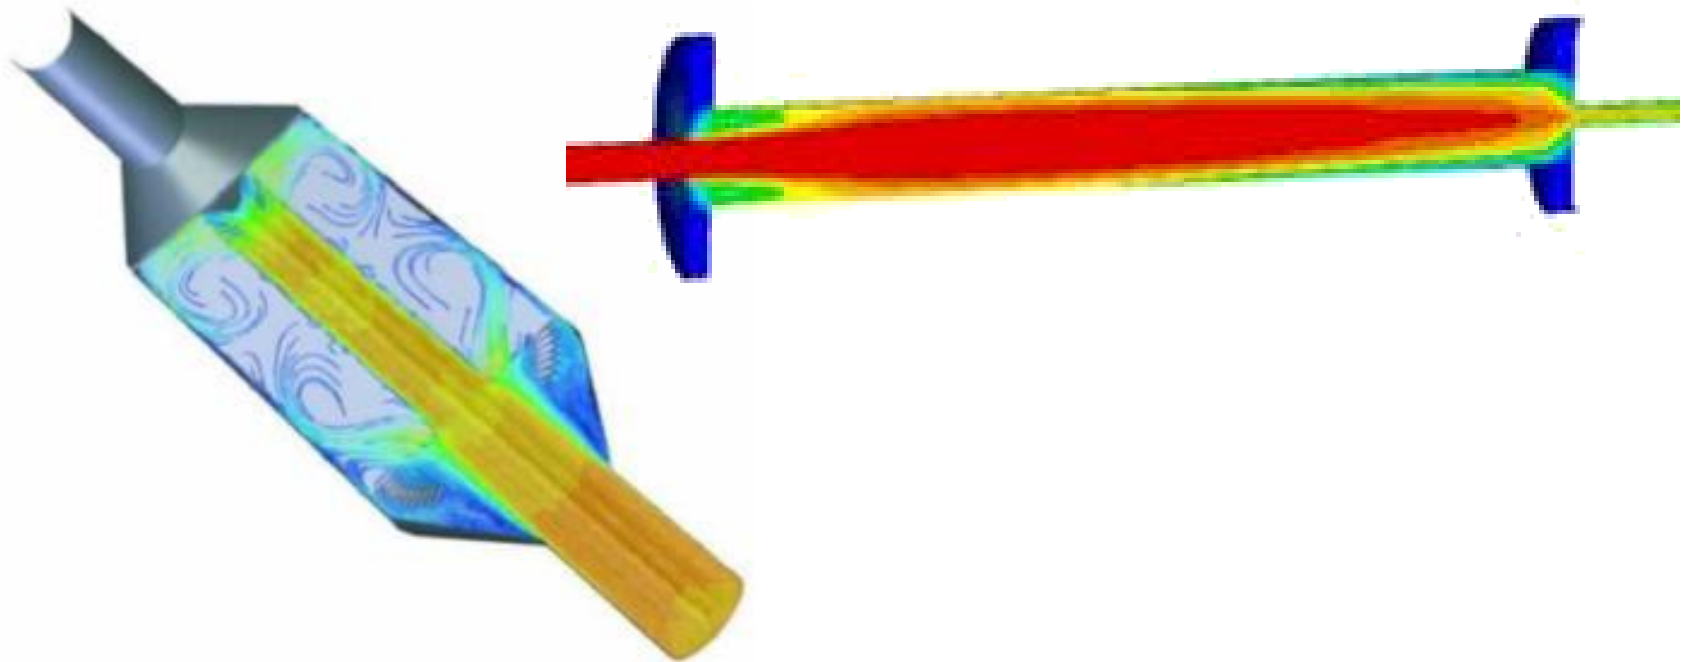

Surfaces and Volume Effects on Sampling and Analysis

Surfaces and Volume Effects on Sampling and Analysis

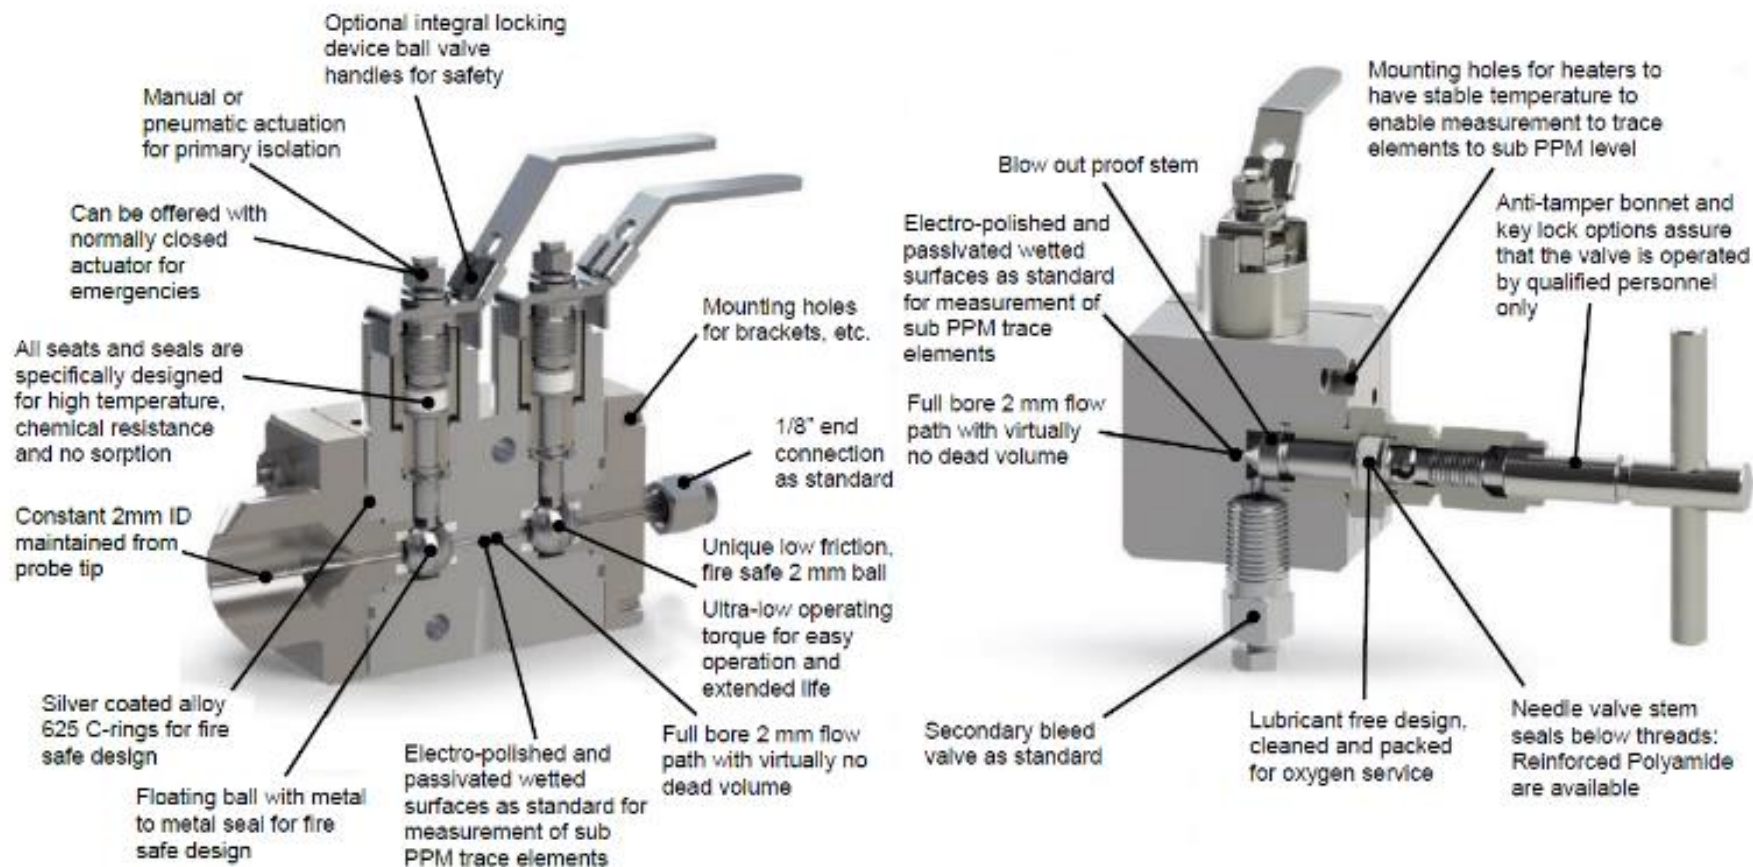

Mixing volumes increase lag times and affect measurement accuracy / response!

Mixing volumes increase lag times and affect measurement accuracy / response!

Alternative Valve Design

Filtration: To collect contamination to prevent it reaching (damaging) the analyser

- Various types
- Typically a mixing volume and large surface area
- Accumulate significant contamination which alters chemical identity of fresh sample
- Changing a filter cartridge may leave residual contamination in filter housing

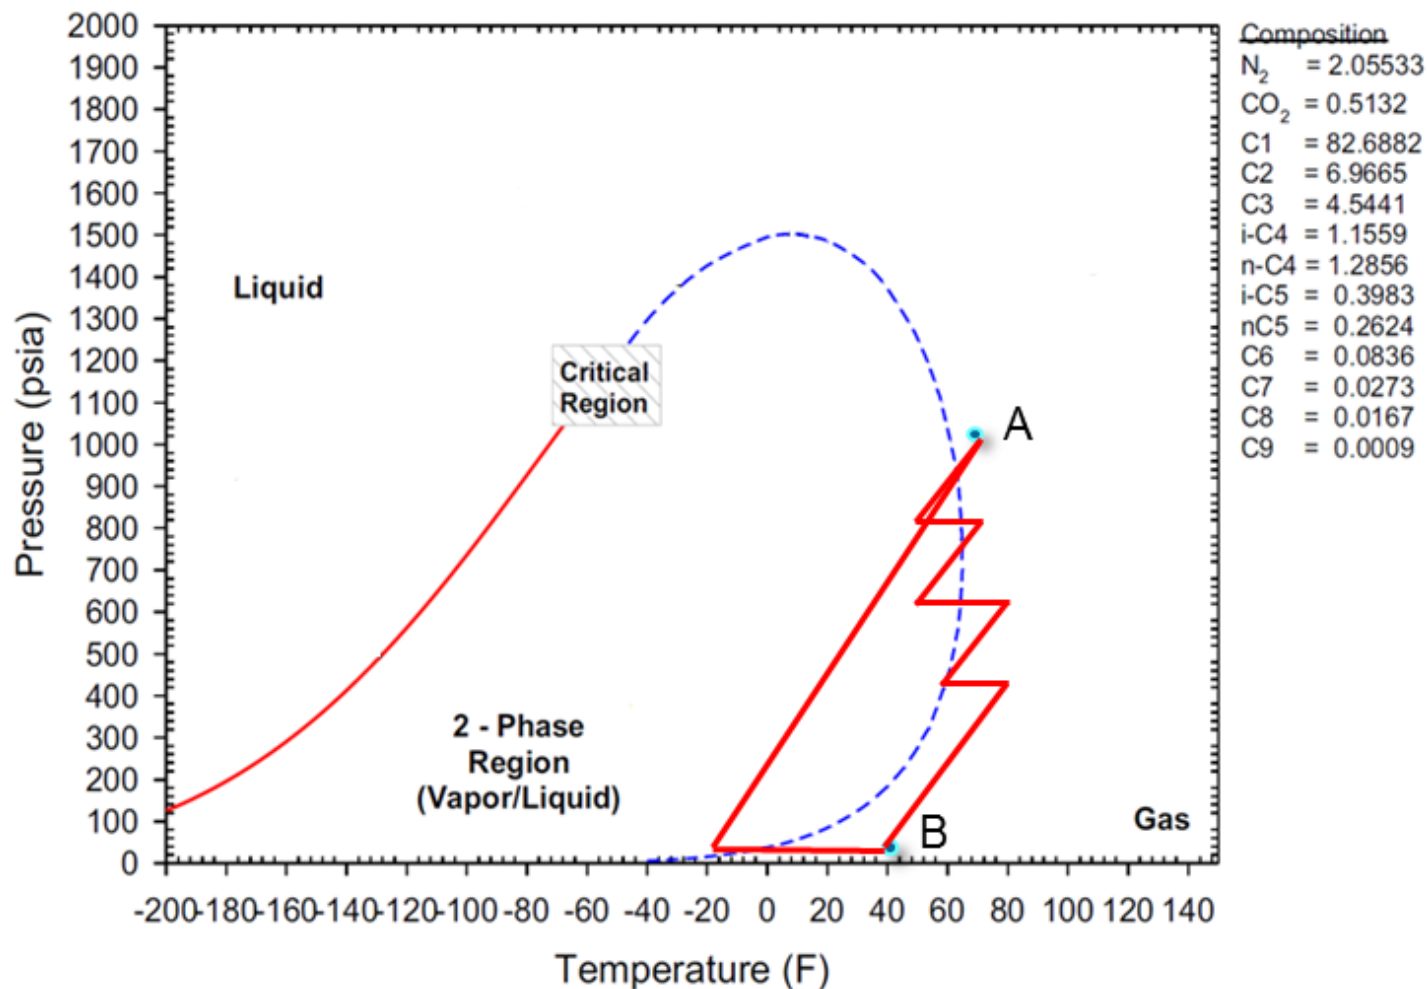

Filtration: To collect contamination to prevent it reaching (damaging) the analyser

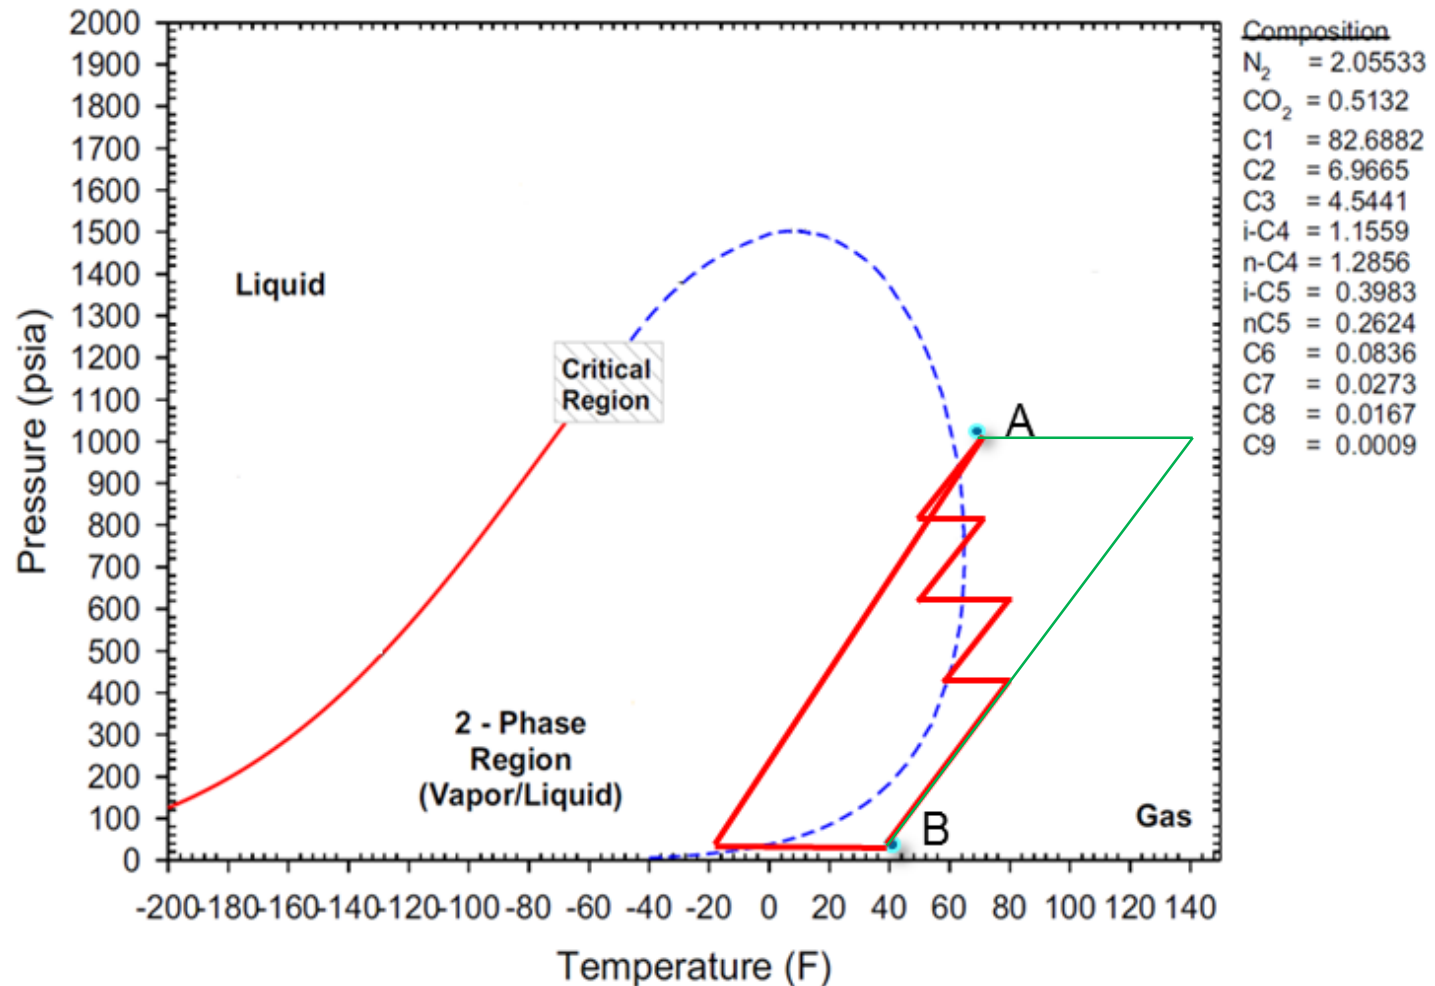

- Aerodynamic probe tip prevents contamination even entering the system!
- In-line filter improves flow path and eliminates mixing volumes
- Sintered stainless steel design ensures similar material chemistry, can be inert coated
- When filter is changed, all contamination is removed

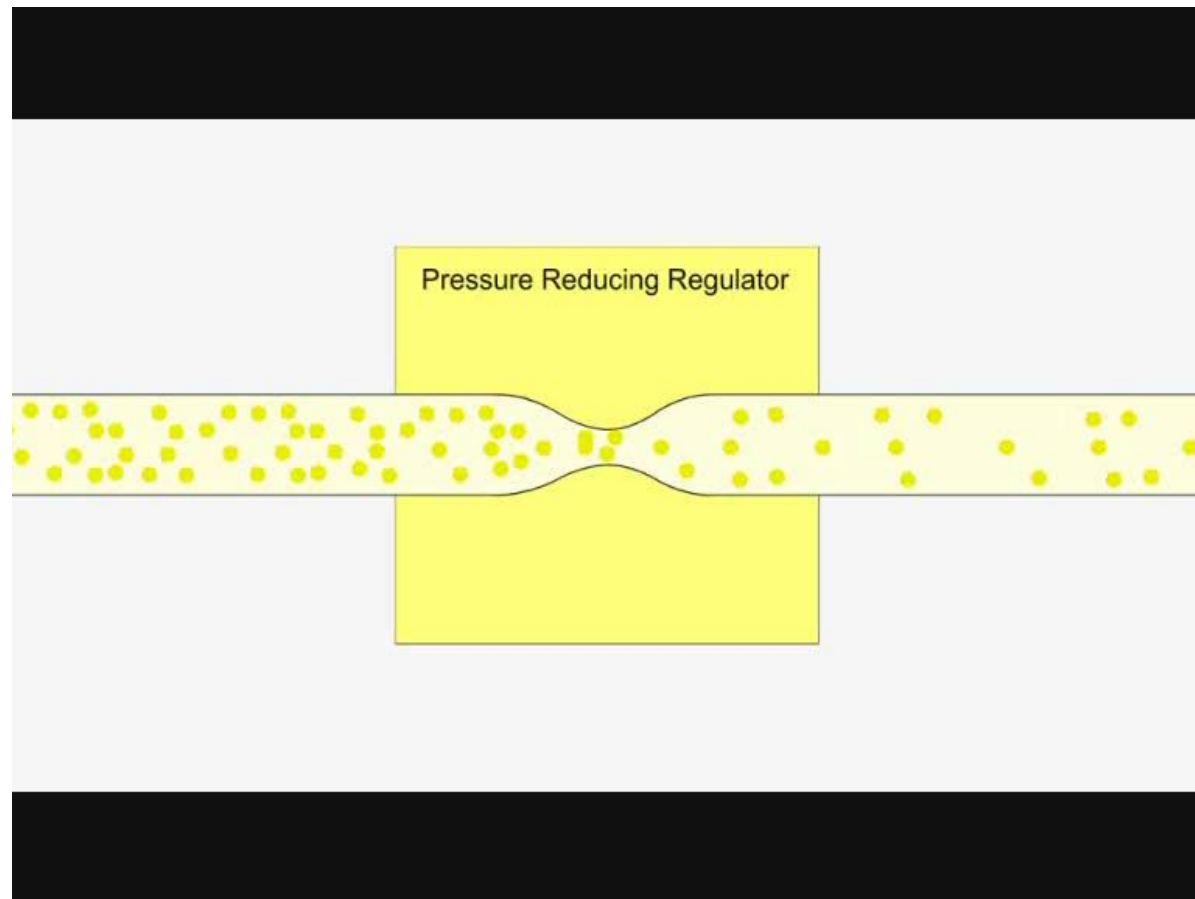

Pressure Reduction / Monitoring

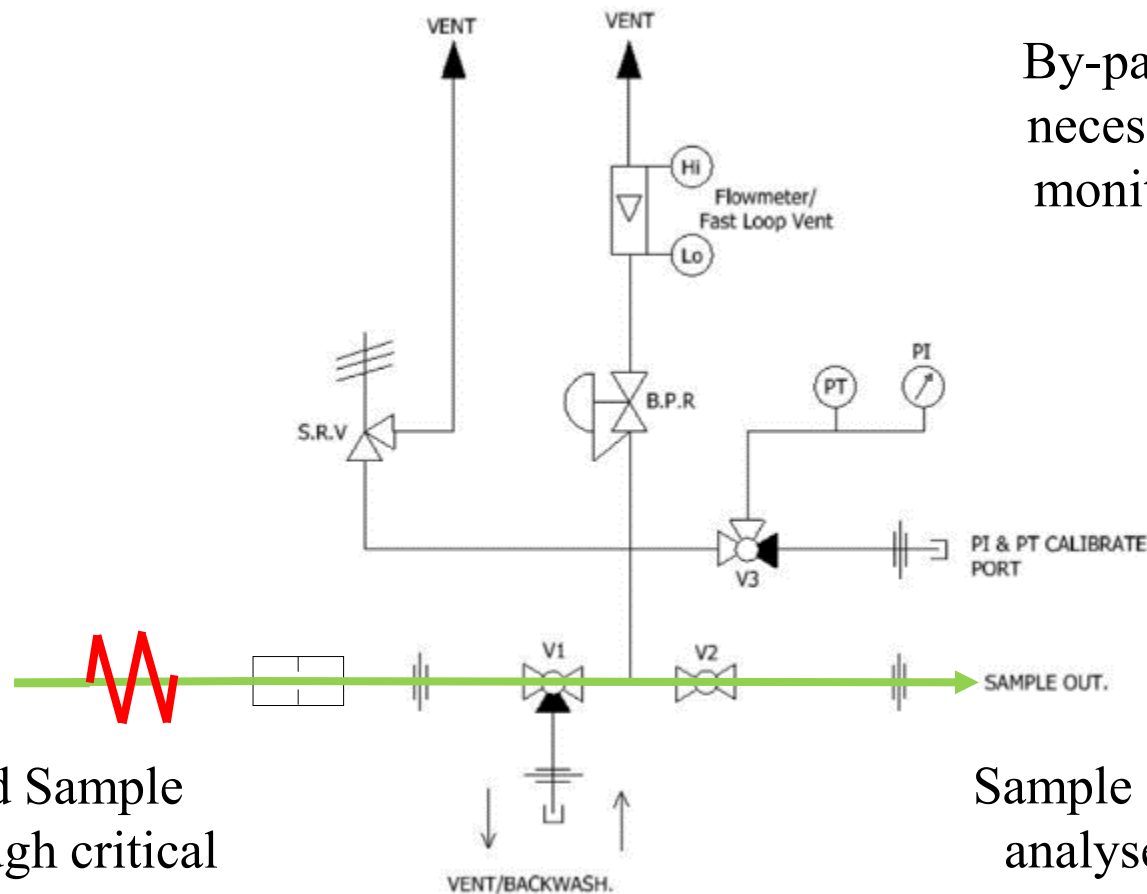

Pressure Reduction / Monitoring Alternative Method

Pressure Reduction / Monitoring

Pressure Reduction / Monitoring Alternative Method

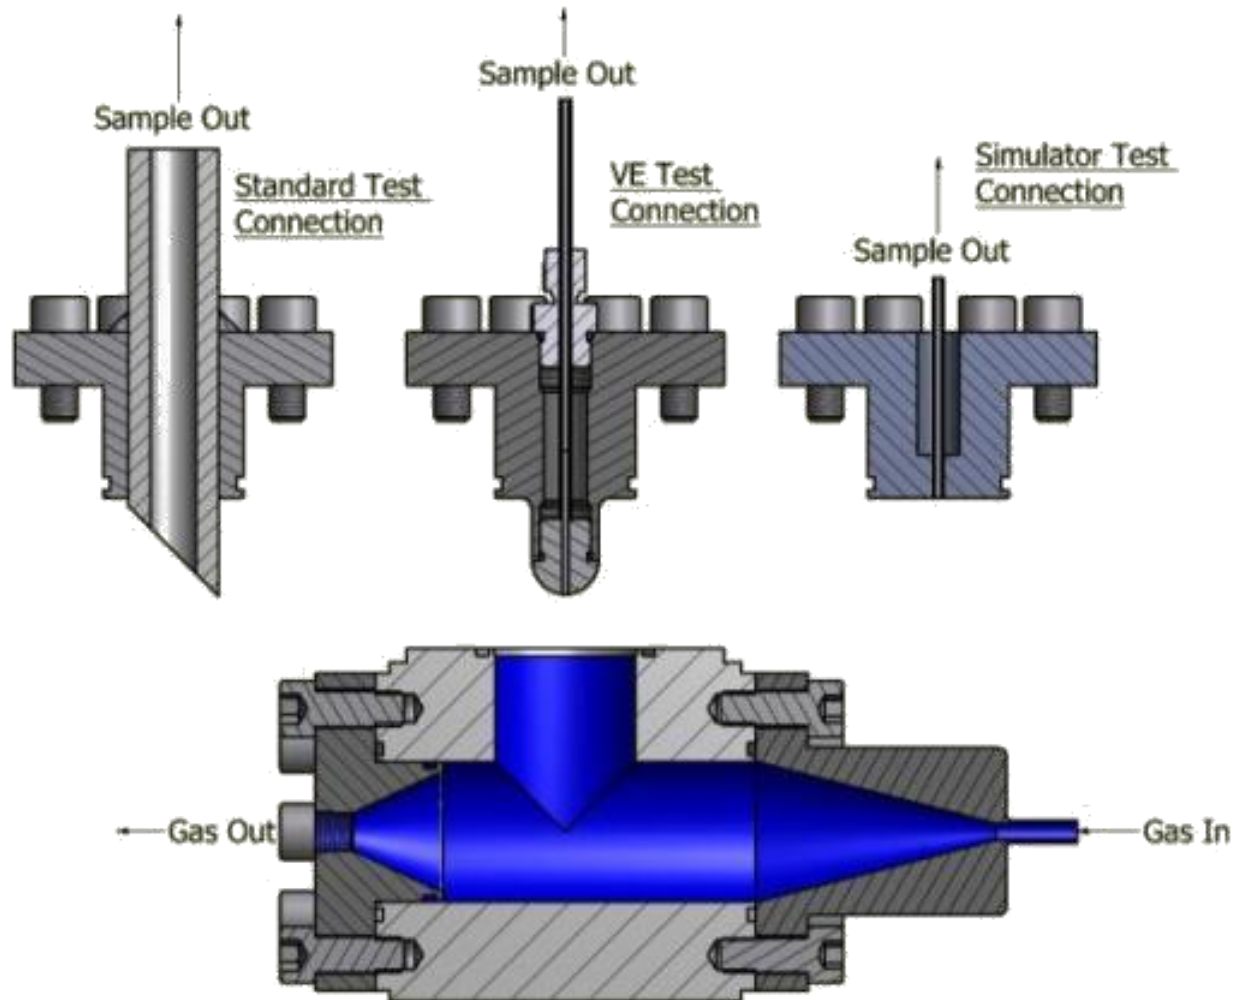

By-pass loop contains necessary control and monitoring functions

Pre-Heated Sample passed through critical orifice to cut the pressure

Sample delivered directly to analyser, without passing through regulator

Sample System Comparison

Sample System Comparison

Typical v Alternative, using H₂S

Comparison between Test Rig 'Input' and Output from VE system

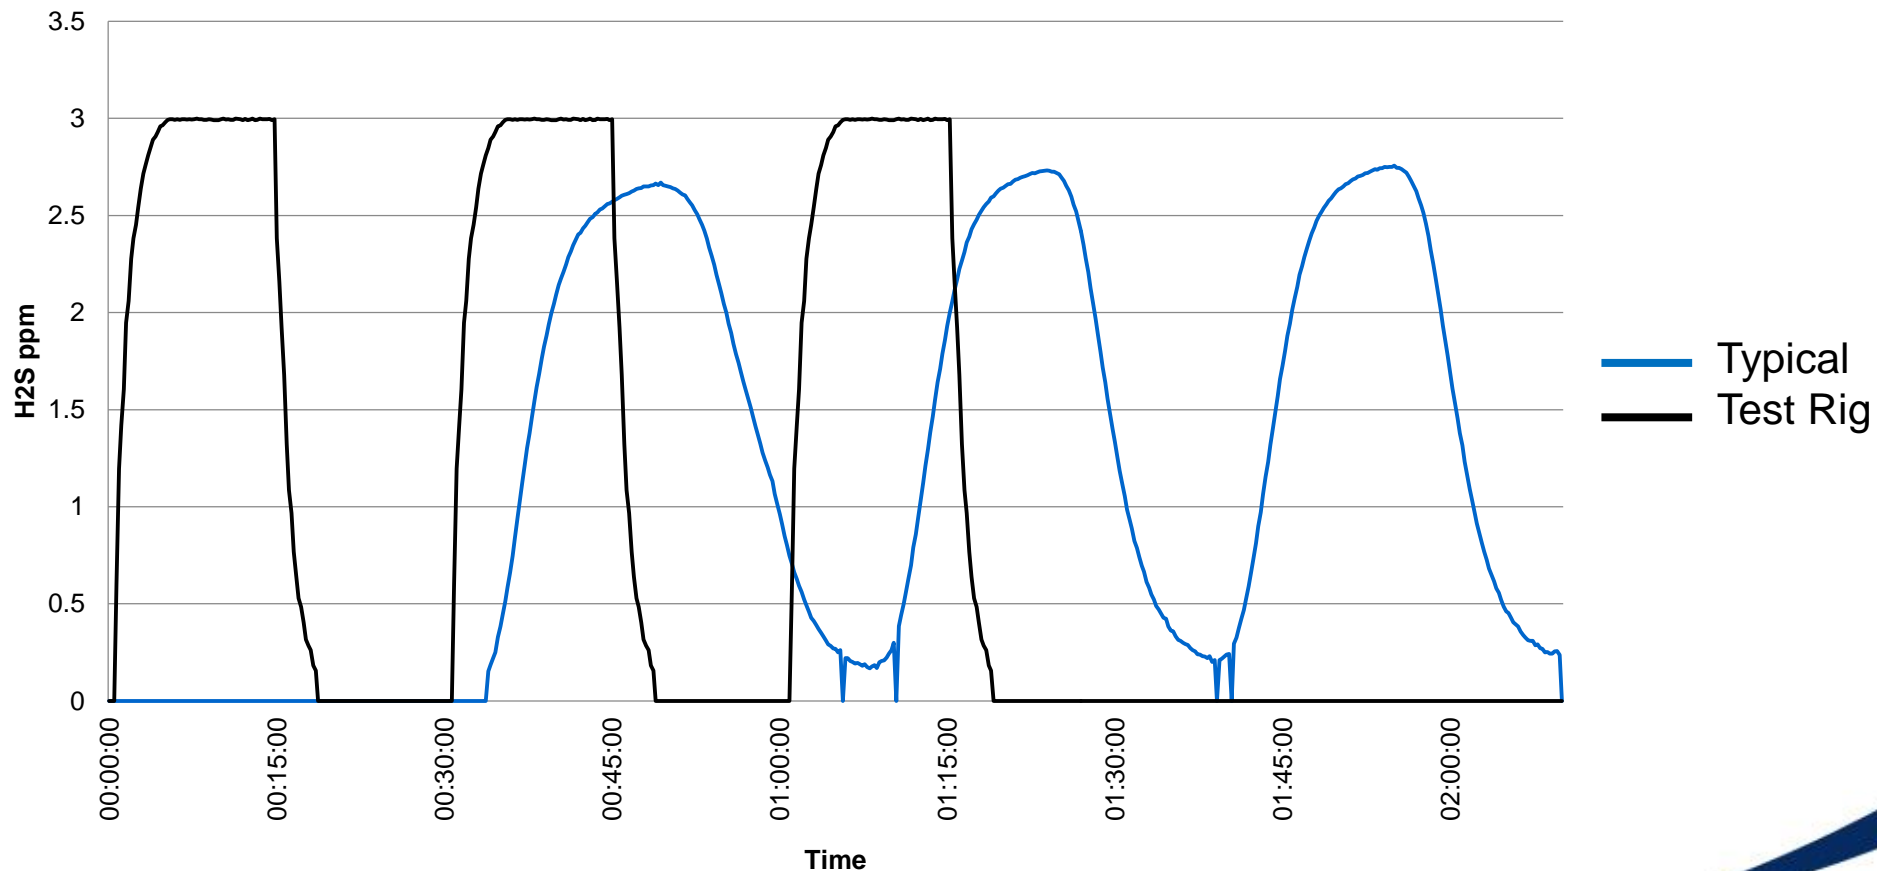

Sample System Comparison

Typical v Alternative, using H₂S

Comparison between Test Rig 'Input' and Output from Conventional system

- The sampling aspect of process measurement is much more scientific and much more complex than is often perceived ([view](#)), but is critical to safe and efficient gas management
- Alternative sample system design delivers significant benefits in a number of aspects, each or all of which may be your project or corporate priority:
 - **Safety**
 - **Measurement performance** (sometimes with safety implication also)
 - **Ongoing costs** (reliability, maintenance, efficiency)
 - **Ease of use** (simple installation, minimal maintenance)
 - **Environment** (low volume, efficient)
- Sampling can and will affect your daily operations!

Thank you for your time and attention

A thick blue curved line is located in the bottom right corner of the slide.
